

Job Accommodation Network (JAN) - Client Evaluation for Manmeet

Answered Problem Sections : 5/5

- Completed both phases of the proposal: EDA/Strategy & Implementation
- Went above and beyond with explaining why Option A & B were invalid by visualizing disability category and explanations of consistent uneven patterns found in the data
- Created a baseline for comparison

Technique Judgment : 5/5

- Derived additional and valuable control variables outside of what I told them
- Disproves bias with data visualizations and statistical percentages
- Clean outputs for model preparation (ex. test/train split & feature selection)

He correctly framed this as supervised classification since fire cause is a known label, and actually justified the approach instead of simply doing what I suggested.

Evaluation/Interpretation Quality : 5/5

- Correctly identified this as a supervised learning problem and further explains why trend prediction isn't viable.
- Very honest about model's quality and prediction
- Converted the dataset's values and number trends into very meaningful percentages.
- Still derived significant insights from the results and tangible solutions despite the models disadvantages.

Communication : 4/5

- The explanations of each cell run on a little longer than they need to.
- Most technical terms were explained in an easy to understand way.
- The model process may be hard to understand for stakeholders and beginner data-scientists. The reasons why some of the scores are significant or what they mean aren't explained.

Open-ended Feedback:

Manmeet did a fantastic job with the dataset I gave them. Every part of the process was extremely thorough and honest about the outcome. Despite the model seemingly not performing well, Manmeet was able to extract meaningful signals that JAN can definitely use in future investigations to their budget problems. For instance, deriving coefficients for each feature in regards to the target outcome is huge in reframing what the company will see as the main problem. My dataset was not very large too (around 260 entries), so they worked very well with what they had.
